Math Review Notes—Convex Optimization

Gregory Faletto

1   Convex Optimization

These are my notes from taking EE 588 at USC taught by Mahdi Soltanolkotabi and the textbook *Convex Optimization* (Boyd and Vandenberghe) 7th printing, as well as Math 541A at USC taught by Steven Heilman.

Need to cover:

- Update rules for optimization problems (e.g. gradient descent, be able to write down gradient, etc.)

- Know which algorithms are useful in which settings

- Homework-like problems from first part of class (no proofs though) (Boyd homework is good practice)

- Understand how to derive algorithms

- Understand how to calculate gradients, proximal functions, etc.

- Understand examples, how to run algorithms

- Only conceptual thing: duality question (write down dual)

- Formulate problems as convex optimization problems

Do not need to cover:

- ADMM

- Proofs from 2nd half of class (rates of convergence, etc.)

- Coding

1.1   Convex Functions

Definition 1.1 (Math 541A definition). Let $\phi : \mathbb{R} \to \mathbb{R}$. We say that ϕ is **convex** if, for any $x, y \in \mathbb{R}$ and for any $t \in [0, 1]$, we have
$$\phi(tx + (1 - t)y) \leq t\phi(x) + (1 - t)\phi(y).$$

Lemma 1 (Result from Math 541A Homework 2). The slope of a convex function is nondecreasing. More formally, let $\phi : \mathbb{R} \to \mathbb{R}$ be a convex function. For any $x \in \mathbb{R}$, let

$$M_R := \{\frac{\phi(c) - \phi(x)}{c - x} : c > x\}, \quad M_L := \{\frac{\phi(x) - \phi(b)}{x - b} : b > x\}$$

be the slopes of the secant lines through ϕ using points to the right and left of x, respectively. Then for any $m \in M_R$, $p \in M_L$ we have $m \geq p$.

Proof. Fix $x \in \mathbb{R}$. Let $m \in M_R, p \in M_L$. By definition, there exist $b < x < c$ such that

$$m = \frac{\phi(c) - \phi(x)}{c - x}, \quad p = \frac{\phi(x) - \phi(b)}{x - b}.$$

Let $t \in (0, 1)$ such that

$$tb + (1 - t)c = x. \tag{1}$$

Then we have

$$m \geq p \iff \frac{\phi(c) - \phi(x)}{c - x} \geq \frac{\phi(x) - \phi(b)}{x - b} \iff (x - b)(\phi(c) - \phi(x)) \geq (c - x)(\phi(x) - \phi(b))$$

$$\iff (x - b)\phi(c) + b\phi(x) \geq c\phi(x) - (c - x)\phi(b)$$

From (1), we have $x - b = tb + (1 - t)c - b = (t - 1)b + (1 - t)c = (1 - t)(c - b)$ and $t(b - c) = x - c \iff t(c - b) = c - x$. Therefore

$$(x - b)\phi(c) + b\phi(x) \geq c\phi(x) - (c - x)\phi(b) \iff (1 - t)(c - b)\phi(c) + b\phi(x) \geq c\phi(x) - t(c - b)\phi(b)$$

$$\iff (1 - t)(c - b)\phi(c) \geq (c - b)\phi(x) - t(c - b)\phi(b) \iff (1 - t)\phi(c) + t\phi(b) \geq \phi(x)$$

But $t\phi(b) + (1 - t)\phi(c) \geq \phi(x)$ since ϕ is convex. Therefore $m \geq p$.

$\square$

Theorem 2 (Result from 541A Homework 2). Let $\phi : \mathbb{R} \to \mathbb{R}$. Then ϕ is convex if and only if: for any $y \in \mathbb{R}$, there exists a constant a and there exists a function $L : \mathbb{R} \to \mathbb{R}$ defined by $L(x) = a(x - y) + \phi(y)$, $x \in \mathbb{R}$, such that $L(y) = \phi(y)$ and such that $L(x) \leq \phi(x)$ for all $x \in \mathbb{R}$. (In the case that ϕ is differentiable, the latter condition says that ϕ lies above all of its tangent lines.)

Proof. $\implies$: As in Lemma 1, let

$$M_R := \{\frac{\phi(c) - \phi(y)}{c - y} : c > y\}, \quad M_L := \{\frac{\phi(y) - \phi(b)}{y - b} : b > y\}$$

be the slopes of the secant lines through ϕ using points to the right and left of y, respectively. Then by Lemma 1, for any $m \in M_R$, $p \in M_L$ we have $m \geq p$, so we can choose some $a_0 \in \mathbb{R}$ such that $p \leq a_0 \leq m$ for all $p \in M_L, m \in M_R$. Then let $L : \mathbb{R} \to \mathbb{R}$ be defined by $L(x) = a_0(x - y) + \phi(y)$, $x \in \mathbb{R}$. Note that $L(y) = \phi(y)$.

We argue that $L(x) \leq \phi(x)$ for all $x \in \mathbb{R}$ by contradiction. Suppose there is some $z \in \mathbb{R}$ with $L(z) > \phi(z)$. Note that $z \neq y$ because we have already shown that $L(y) = \phi(y)$. Then we have

$$L(z) > \phi(z) \iff a_0(z - y) + \phi(y) > \phi(z) \tag{2}$$

If $z > y$, then we can solve (2) for a_0 as follows:

$$a_0 > \frac{\phi(z) - \phi(y)}{z - y}$$

But $z \in M_R$, so we have $\frac{\phi(z) - \phi(y)}{z - y} > a_0$. Contradiction. If $z < y$, we solve (2) for a_0 as follows:

$$a_0 < \frac{\phi(z) - \phi(y)}{z - y} = \frac{\phi(y) - \phi(z)}{y - z}$$

But $z \in M_L$, so we have $\frac{\phi(y) - \phi(z)}{y - z} < a_0$. Contradiction. Therefore for every $z \in \mathbb{R}$ we have $L(z) \leq \phi(z)$ as desired.

$\impliedby$: Now suppose that for any $y \in \mathbb{R}$ there exists a constant a and a function $L : \mathbb{R} \to \mathbb{R}$ defined by $L(x) = a(x - y) + \phi(y)$, $x \in \mathbb{R}$, such that $L(y) = \phi(y)$ and such that $L(x) \leq \phi(x)$ for all $x \in \mathbb{R}$.

Fix $b, c \in \mathbb{R}$ and let $t \in (0, 1)$. Set $y := tb + (1 - t)c$. Then by assumption we can write

$$a(b - y) + \phi(y) \leq \phi(b), \qquad a(c - y) + \phi(y) \leq \phi(c)$$

Multiply by $t > 0$ and $(1 - t) > 0$ respectively to yield

$$ta(b - y) + t\phi(y) \leq t\phi(b), \qquad (1 - t)a(c - y) + (1 - t)\phi(y) \leq (1 - t)\phi(c) \tag{3}$$

Note that

$$ta(b - y) + (1 - t)a(c - y) = a(tb - ty + (c - y - ct + yt)) = a(tb + c - y - ct)$$

$$= a(tb + c(1 - t) - tb - (1 - t)c) = 0$$

So adding the inequalities in (3) yields

$$t\phi(y) + (1 - t)\phi(y) \leq t\phi(b) + (1 - t)\phi(c) \iff \phi(y) \leq t\phi(b) + (1 - t)\phi(c)$$

$$\iff \phi(tb + (1 - t)c) \leq t\phi(b) + (1 - t)\phi(c).$$

$\square$

My original proof from submitted homework. If ϕ is differentiable at y, let $a = \phi'(y)$. If not, let a be any subgradient of ϕ at y. Then $L(x)$ is (a) tangent line to ϕ at y, which should be lesser than or equal to ϕ for all $x \in \mathbb{R}$ if ϕ is convex. If and only if this is true at every $y \in \mathbb{R}$ (the tangent line is a global underestimator at y for every $y \in \mathbb{R}$), then ϕ must be convex. We proceed to show this formally:

$\implies$: We will show that if ϕ is convex; that is, if for any $x, y \in \mathbb{R}$ and for any $t \in [0, 1]$, we have

$$\phi(tx + (1-t)y) \le t\phi(x) + (1-t)\phi(y) \tag{4}$$

then the inequality

$$\phi'(y)(x-y) + \phi(y) \le \phi(x) \quad \forall x \in \mathbb{R} \tag{5}$$

holds. Starting from (4) note that

$$\phi(tx + (1-t)y) \le t\phi(x) + (1-t)\phi(y) \implies \phi(tx + (1-t)y) - \phi(x) \le (1-t)(\phi(y) - \phi(x))$$

Suppose $y > x$. Then $tx + (1-t)y - x = (1-t)(y-x) > 0$, so we can divide by it on both sides:

$$\implies \frac{\phi(tx + (1-t)y) - \phi(x)}{tx + (1-t)y - x} \le \frac{(1-t)(\phi(y) - \phi(x))}{(1-t)(y-x)} \implies \frac{\phi(tx + (1-t)y) - \phi(x)}{tx + (1-t)y - x} \le \frac{\phi(y) - \phi(x)}{y - x}$$

Taking the limit as $t \to 1$ yields

$$\phi'(x) \le \frac{\phi(y) - \phi(x)}{y - x}$$

if ϕ is differentiable, which is (equivalent to) what we hoped to prove. The case where $x > y$ is analogous.

$\impliedby$: We will show that if (5) holds then ϕ is convex; that is, (4) holds for any $x, y \in \mathbb{R}$ and for any $t \in [0, 1]$. Starting from (5) note that

$$\phi'(y)(x-y) + \phi(y) \le \phi(x) \iff \phi'(y) \le \frac{\phi(x) - \phi(y)}{x - y} \quad \forall x, y \in \mathbb{R}$$

$\square$

Theorem 3 (Jensen's Inequality, from Math 541A). Let $X : \Omega \to [-\infty, \infty]$ be a random variable. Let $\phi : \mathbb{R} \to \mathbb{R}$ be convex. Assume that $\mathbb{E}|X| < \infty$ and $\mathbb{E}|\phi(X)| < \infty$. Then

$$\phi(\mathbb{E}X) \le \mathbb{E}\phi(X).$$

Proof. Note that from Theorem 2, for any $y \in \mathbb{R}$ there exists a constant a and a function L such that

$$a(x - y) + \phi(y) \leq \phi(x) \quad \forall x \in \mathbb{R}$$

Letting $y = \mathbb{E}(X)$ we have

$$a(X - \mathbb{E}X) + \phi(\mathbb{E}X) \leq \phi(X)$$

Since expectations preserve inequalities,

$$\mathbb{E}[a(X - \mathbb{E}X) + \phi(\mathbb{E}X)] \leq \mathbb{E}\phi(X)$$

But

$$\mathbb{E}[a(X - \mathbb{E}X) + \phi(\mathbb{E}X)] = a(\mathbb{E}X - \mathbb{E}X) + \mathbb{E}(\phi(\mathbb{E}X)) = \phi(\mathbb{E}X)$$

which yields

$$\phi(\mathbb{E}X) \leq \mathbb{E}\phi(X).$$

□

Corollary 3.1 (**Jensen's Inequality: EE 588 Formulation**). f is convex if and only if

$$f\left(\frac{a + b}{2}\right) \leq \frac{f(a) + f(b)}{2}$$

for all $a, b \in \mathbf{dom}(f)$.

Proof. Follows from Theorem 3 if X is a discrete random variable that equals a or b each with probability $1/2$ and $\phi(X) = f(X)$. Note that $\phi(X)$ is convex.

□

Corollary 3.2 (**Triangle Inequality**). Let $X : \Omega \to [-\infty, \infty]$ be a random variable with $\mathbb{E}|X| < \infty$. Then

$$\|EX| \leq \mathbb{E}|X|.$$

Proof. Note that $\phi(x) = |x|$ is convex by the definition of convexity: for any $x, y \in \mathbb{R}$ and for any $t \in (0, 1)$, we have

$$\phi(tx + (1 - t)y) = |tx + (1 - t)y| \leq \ldots = t|x| + (1 - t)|y| = t\phi(x) + (1 - t)\phi(y).$$

Then the result follows immediately from Jensen's Inequality (Theorem 3) using $\phi(X) = |X|$:

$$|\mathbb{E}X| \leq \mathbb{E}|X|$$

$\square$

1.2   Schur Complement Trick

1.2.1   Definition

For a matrix $X \in \boldsymbol{S}^n$ partitioned as

$$X = \begin{bmatrix} A & B \\ B^T & C \end{bmatrix}$$

the Schur complement is (if $\mathbf{det}(A) \neq 0$)

$$S = C - B^T A^{-1} B$$

The Schur complement has two useful properties in convex analysis.

Theorem 4. (a) $X \succ 0$ if and only if $A \succ 0$ and $S \succ 0$.

(b) If $A \succ 0$, then $X \succeq 0$ if and only if $S \succeq 0$.

1.2.2   The Trick

Suppose we are trying to express a problem as a semidefinite program (SDP); that is, in the form

$$
\begin{aligned}
\text{minimize} \quad & c^T x \\
\text{subject to} \quad & x_1 F_1 + \ldots + x_n F_n + G \preceq 0 \\
& Ax = b
\end{aligned}
$$

where $G, F_1, \ldots, F_n \in \boldsymbol{S}^k$ and $A \in \mathbb{R}^{p \times n}$. If we have a constraint of the form $c^T F(x)^{-1} c \leq t$ where $F(x)$ is symmetric and positive definite and $t \in \mathbb{R}$, by Theorem 4(b) we can write

$$c^T F(x)^{-1} c \leq t \iff \begin{bmatrix} F(x) & c \\ c^T & t \end{bmatrix} \succeq 0$$

in order to get our constraint in the form required for an SDP.

1.2.3 Example 1: Last Year's Final, Question 2(b)

Suppose we have the constraints

$$Ax + b \geq 0$$
$$\frac{(c^T x)^2}{d^T x} \leq t$$

which we would like to express in an SDP. By Theorem 4(b) we can write

$$\frac{(c^T x)^2}{d^T x} \leq t \iff d^T x - (c^T x)^T t^{-1} c^T x \geq 0 \iff \begin{bmatrix} t & c^T x \\ c^T x & d^T x \end{bmatrix} \succeq 0$$

Since

$$Ax + b \geq 0 \iff \mathbf{diag}(Ax + b) \succeq 0$$

we can finally write our constraints as

$$\begin{bmatrix} \mathbf{diag}(Ax + b) & 0 & 0 \\ 0 & t & c^T x \\ 0 & c^T x & d^T x \end{bmatrix} \succeq 0$$

1.2.4 Example 2: Last Year's Final, Question 4(b)

Suppose we have the constraints

$$Ax + b \geq 0$$
$$\frac{(c^T x)^2}{d^T x} \leq t$$

which we would like to express in an SDP. By Theorem 4(b) we can write

$$\frac{(c^T x)^2}{d^T x} \leq t \iff d^T x - (c^T x)^T t^{-1} c^T x \geq 0 \iff \begin{bmatrix} t & c^T x \\ c^T x & d^T x \end{bmatrix} \succeq 0$$

Since

$$Ax + b \geq 0 \iff \mathbf{diag}(Ax + b) \succeq 0$$

we can finally write our constraints as

$$\begin{bmatrix} \mathbf{diag}(Ax+b) & 0 & 0 \\ 0 & t & c^T x \\ 0 & c^T x & d^T x \end{bmatrix} \succeq 0$$

1.3 Duality

Theorem 5. Slater's condition/constraint qualification: Strong duality holds for a convex problem

$$\begin{aligned} \text{minimize} \quad & f_0(x) \\ \text{subject to} \quad & f_i(x) \le 0, i = 1, \ldots, m \\ & Ax = b \end{aligned}$$

if it is strictly feasible, i.e., there exists at least one x in the domain of f_0 such that $f_i(x) < 0, \; i = 1, 2, \ldots, m$, $Ax = b$.

1.4 MLE estimates

For linear estimates with iid noise

$$y_i = a_i^T x + v_i, i = 1, \ldots, m$$

where a is observed and $x \in \mathbb{R}^n$ are the parameters to be estimated, the likelihood function is

$$p_x(y) = \prod_{i=1}^m \Pr(v_i = y_i - a_i^T x \mid x)$$

Therefore the log likelihood function is:

$$\ell_x(y) = \sum_{i=1}^m \log[\Pr(v_i = y_i - a_i^T x \mid x)]$$

1.5 Practice Final (2017 Final)

(1) (a) Strictly convex. Multiply by x/x (allowed in this case since $x > 0$) to get $\frac{x^2}{x+1}$ which is a quadratic over linear, which is convex in $\mathbb{R}^{++}$ according to CVX rules.

(b) Not convex, it is convex for $x \ge -1$, but there is a boundary problem at $x = -1$. Note that Jensen's inequality (Theorem 3.1)

$$\frac{f(a) + f(b)}{2} \ge f\left(\frac{a+b}{2}\right)$$

is violated because

$$\frac{f(-1.3) + f(-0.9)}{2} = \frac{2.3 + 0}{2} = 1.15 \le 2.2 = f(-1.1) = f\left(\frac{-1.3 + -0.9}{2}\right)$$

(c)

(d)

$$f(x) = \sup \log\left(\frac{p(t)}{q(t)}\right) = \sup\{\log p(t) - \log q(t)\} = \sup\{\log\left(\sum_{i=1}^{n} \exp(x_i \sin(it))\right) - \sum_{i=1}^{n} x_i \sin(it)\}$$

(e) The proximal mapping is

$$\text{prox}_{\mathcal{R}}(z) = \arg\min_{y} \frac{1}{2}\|z - y\|_2^2 + \mathcal{R}(y) = \arg\min_{y} \frac{1}{2}\sum_{i=1}^{n}(z_i - y_i)^2 + \sum_{i=1}^{n} w_i|y_i|$$

$$= \arg\min_{y} \frac{1}{2}\sum_{i=1}^{n}\left[(z_i - y_i)^2 + w_i|y_i|\right]$$

Taking the gradient of the inside quantity with respect to y, we have

$$\nabla(y) = \begin{pmatrix} \frac{1}{2}\cdot 2(z_1 - y_1) + \mathbf{sign}(y_1)w_1 \\ \frac{1}{2}\cdot 2(z_2 - y_2) + \mathbf{sign}(y_2)w_2 \\ \vdots \\ \frac{1}{2}\cdot 2(z_n - y_n) + \mathbf{sign}(y_n)w_n \end{pmatrix} = \begin{pmatrix} z_1 - y_1 + \mathbf{sign}(y_1)w_1 \\ z_2 - y_2 + \mathbf{sign}(y_2)w_2 \\ \vdots \\ z_n - y_n + \mathbf{sign}(y_n)w_n \end{pmatrix}$$

Setting equal to 0, we have

$$y = \begin{pmatrix} z_1 \pm w_1 \\ z_2 \pm w_2 \\ \vdots \\ z_n \pm w_n \end{pmatrix}$$

(2) (a) The constraint is convex (affine). The denominator is affine. Since $c^T x = x^T c$, the numerator

$$(c^T x)^2 = (c^T x)(c^T x) = x^T cc^T x = x^T(cc^T)x$$

is convex since cc^T is positive semidefinite.

(b) We start by using the epigraph trick to transform the problem:

$$\begin{aligned} \text{minimize} \quad & t \\ \text{subject to} \quad & \frac{(c^T x)^2}{d^T x} \le t \\ & Ax + b \ge 0 \end{aligned}$$

We are trying to express this problem as a semidefinite program (SDP); that is, in the form

$$\begin{aligned} \text{minimize} \quad & c^T x \\ \text{subject to} \quad & x_1 F_1 + \ldots + x_n F_n + G \preceq 0 \\ & Ax = b \end{aligned}$$

where $G, F_1, \ldots, F_n \in \mathbf{S}^k$ and $A \in \mathbb{R}^{p\times n}$. The first constraint

$$\frac{(c^T x)^2}{d^T x} \le t$$

can be expressed in the form

$$(c^T x)^2 \le t d^T x \iff (c^T x c^T - t d^T)x \le 0$$

We have a constraint

$$Ax + b \ge 0$$

which can be expressed in the form

$$Ax \ge -b$$

$$c^T F(x)^{-1} c \le t$$

where $F(x)$ is symmetric and positive definite and $t \in \mathbb{R}$, by Theorem 4(b) we can write

$$c^T F(x)^{-1} c \le t \iff \begin{bmatrix} F(x) & c \\ c^T & t \end{bmatrix} \succeq 0$$

in order to get our constraint in the form required for an SDP.

(3) (a) Yes, g is convex over $\mathcal{X}$ since it is quadratic over linear.

   (b) The only points satisfying the constraint have $x_1 = 0$. Therefore the primal optimal value (the only feasible value) is $e^0 = \boxed{1}$.

   (c) Lagrangian:

$$L(x, \lambda) = e^{-x_1} + \lambda(x_1^2/x_2)$$

   The Lagrangian obtains its minimum value of 0 when $x_2 = x_1^3$ and $x_1 \to \infty$. Thus, its dual function $(g(\lambda) = \min_x L(x, \lambda))$ is

$$g(\lambda) = 0$$

   The dual problem is then

$$\boxed{\begin{array}{ll} \text{maximize} & 0 \\ \text{subject to} & \lambda \ge 0 \end{array}}$$

   (d) The optimal value of the dual problem is 0. Strong duality does not hold since the optimum of the dual problem is less than the optimum of the primal problem. We can also tell this because Slater's Condition (Theorem 5) is violated; that is, there is no (x_1, x_2) that is strictly feasible since x_1 must equal 0, which is on the boundary of the feasible region.

   (e) Now for the primal problem, instead of $x_1 = 0$, we have

$$\frac{x_1^2}{x_2} \le u \iff x_1^2 \le ux_2 \implies -\sqrt{ux_2} \le x_1 \le \sqrt{ux_2}$$

Since e^{-x_1} is minimized as $x_1 \to \infty$, our optimal solution is $x_2 \to \infty, x_1 = \sqrt{ux_2} \to \infty$ yielding a primal optimal value of $\boxed{0}$. For the dual problem, we have

$$L(x, \lambda) = e^{-x_1} + \lambda\left(\frac{x_1^2}{x_2} - u\right)$$

Dual function $(g(\lambda) = \min_x L(x, \lambda))$:

$$\frac{x_1^2}{x_2} - u = 0 \implies x_2 = \frac{x_1^2}{u}$$

and let $x_1 \to -\infty$ to yield

$$g(\lambda) = 0$$

The dual problem is then

$$\boxed{\text{maximize} \quad 0}$$

with optimal value 0, so there is no longer a duality gap. We can also tell this because Slater's Condition (Theorem 5) is satisfied; that is, there exists an (x_1, x_2) which is strictly feasible (say $(x_1, x_2) = (\sqrt{u}, 10)$.

(4) (a) Yes, the set is convex. If $(u_i, v_i) = \boldsymbol{u}_i$, each

$$\sqrt{(x - u_i)^2 + (y - v_i)^2} = \|\boldsymbol{x} - \boldsymbol{u}_i\|_2$$

is convex in $\boldsymbol{x}$. Therefore the function

$$\sum_{i=1}^{k} \|\boldsymbol{x} - \boldsymbol{u}_i\|_2$$

is convex. For any fixed d, this set is a sublevel set of this function, which is convex since the function is convex.

(b) This is a feasibility problem:

$$
\begin{aligned}
\text{find} \qquad & \boldsymbol{x} \\
\text{subject to} \quad & \sum_{i=1}^{k} \|\boldsymbol{x} - \boldsymbol{u}_i\| \leq d \\
& \sum_{i=1}^{j} \|\boldsymbol{x} - \boldsymbol{v}_i\| \leq e
\end{aligned}
$$

or

$$
\begin{aligned}
\text{minimize} \qquad & 0 \\
\text{subject to} \quad & \sum_{i=1}^{k} \|\boldsymbol{x} - \boldsymbol{u}_i\| \leq d \\
& \sum_{i=1}^{j} \|\boldsymbol{x} - \boldsymbol{v}_i\| \leq e
\end{aligned}
$$

for two sets of points in $\mathbb{R}^2$ $\boldsymbol{u}_1, \ldots, \boldsymbol{u}_k$, $\boldsymbol{v}_1, \ldots, \boldsymbol{v}_j$. We would like to express these constraints as matrix inequalities in order to have an SDP. To do this, first rewrite the problem as

$$
\begin{aligned}
\text{minimize} \quad & 0 \\
\text{subject to} \quad & \|\boldsymbol{x} - \boldsymbol{u}_i\| \le t_i, i = 1, \ldots, k \\
& \|\boldsymbol{x} - \boldsymbol{v}_i\| \le s_i, s = 1, \ldots, j \\
& \mathbf{1}^T t \le d \\
& \mathbf{1}^T s \le e
\end{aligned}
$$

Then note that we can use the Schur trick:

$$
(\boldsymbol{x} - \boldsymbol{u}_i)^T I (\boldsymbol{x} - \boldsymbol{u}_i) \le t_i \iff \begin{bmatrix} I & \boldsymbol{x} - \boldsymbol{u}_i \\ (\boldsymbol{x} - \boldsymbol{u}_i)^T & t_i \end{bmatrix} \succeq 0
$$

and write the optimization problem as an SDP:

$$
\boxed{
\begin{aligned}
\text{minimize} \quad & 0 \\
\text{subject to} \quad & \begin{bmatrix} I & \boldsymbol{x} - \boldsymbol{u}_i \\ (\boldsymbol{x} - \boldsymbol{u}_i)^T & t_i \end{bmatrix} \succeq 0, i = 1, \ldots, k \\[2mm]
& \begin{bmatrix} I & \boldsymbol{x} - \boldsymbol{v}_i \\ (\boldsymbol{x} - \boldsymbol{v}_i)^T & s_i \end{bmatrix} \succeq 0, s = 1, \ldots, j \\[2mm]
& \mathbf{1}^T t \le d \\
& \mathbf{1}^T s \le e
\end{aligned}
}
$$

(5) (a) To minimize the MSE:

$$
\mathcal{L}(z) = \sum_r (y_r - |a_r^T x|^2)^2
$$

For MLE estimate:

$$
p_x(y) = \prod_{r=1}^m \Pr(w_r = y_r - (a_r^T x)^2 \mid x) = \frac{1}{(y_r - (a_r^T x)^2)!} \cdot \exp\big(-(a_r^T x)^2\big) \cdot (a_r^T x)^{2[y_r - (a_r^T x)^2]}
$$

Therefore the log likelihood function is:

$$
\ell_x(y) = \sum_{i=1}^m \log[\Pr(y_i - a_i^T x \mid x)] = \sum_{i=1}^m \log\left[\frac{1}{(y_r - (a_r^T x)^2)!} \cdot \exp\big(-(a_r^T x)^2\big) \cdot (a_r^T x)^{2[y_r - (a_r^T x)^2]}\right]
$$

$$
= \sum_{i=1}^m \log\left[\frac{1}{(y_r - (a_r^T x)^2)!}\right] - (a_r^T x)^2 + 2[y_r - (a_r^T x)^2] \cdot \log\big[(a_r^T x)\big]
$$
